Hole Paradox Introduction To put the black holes we know about into perspective, we have two big events to draw from. Arthur C. Clarke's 2001: A Space Odyssey features a black hole as an essential part of the solar system that is at the heart of the movie. The black hole takes up a very small portion of the screen but when we get a glimpse inside the solar system it is this black hole that lies at the heart of the solar system. This black hole is awesome but never appears. If we view the black hole from the outside it looks weird, bulking up too large and distorted. Across from this black hole, there's a black hole that appears in Stephen Hawking's A Brief History of Time which he frames as an object not to be feared but to be studied. If you look at the Hawking's black hole it is very small or how he describes it he is saying that it is the same size as the event horizon of the black hole that we know about which is not the case. The black hole that he describes is only miles away for a mini black hole. Hawking calls the mini black hole "a cosmic gramophone" a device that is only inches away from the event horizon or the mini black hole but plays the same piece of music as the super massive black hole (1075 suns) that we've come to know as a way to describe it. The super massive black hole is 12 billion light years away from us so when people discuss the mini black hole, they are dealing with a distance that we cannot go to and need a device to explain how small the black hole is if we were to imagine to get closer to it. Both of these black holes are in their own category but both fit into the category of a super massive black hole. One worries us and the other appears and isn't to be feared but you have to be smart to keep up with what he describes. The super massive black hole also provides a clear example of a black hole. The mini black hole is miniscule when you picture one of the five super massive black holes that we have in the universe and at the same time are those first of many that we will find with Planck wave experiments. Hawking's mini black holes sound like cosmic gramophones that are close to the event horizon of a super massive black hole and you can picture an image of it and find a
