### What's New In?

INZ APKTool is an app that, in its base version, offers users the opportunity to decompile or recompile the APK files and to reconstruct them to their original APK format. For the new release, an effort was made to add features that were requested by users, such as file alignment, the APK bundle and the possibilities of ZIP compression and decompression, as well as a few other additions. The functionality of the app works similarly to a file manager, in the sense that users will have to navigate through the different folders by using buttons that are presented in the GUI. There is a specific list in the main interface with the different files that are found in the application. To decompile or recompile the APK files, the user will have to choose the directory they want to access, and enter it. In the case of the latter, users can specify the directory and all of the files in the same folder will be extracted to their original formats. They can also re-compress the extracted files in order to compress them, as well as compress the APK file, if necessary. For JAR or DEX decompiler, the specific options are the directories where those files will be decompiled to. All of the listed files will be extracted to their original format, regardless of the decompiler selected. Tips; When extracting and decompiling files, if users use ZIP, they will be able to decompile them much faster. In case of errors in the output file, users can select a different version of the decompiler or the set of files to be decompiled, in order to see the log that will help point-out the encountered errors. The GUI is also fully keyboard-compatible and there is no need to exit it in order to perform the different actions mentioned above. Features: The functionality offered by INZ APKTool is quite extensive, as the main goal of the app is to allow users to achieve different tasks regarding the build or the apk/apk files. During the extraction of APK files, the following options are offered: - APK extraction - APK decompilation - APK file alignment - ZIP compression and decompression - ZIP bundle - ZIP signer and keygen - APK reconstruction Help: INZ APKTool is a cross-platform app, so the source code is built for Java, and then provided for the native-language apps that are compatible with the ARM, Android-x86 and Windows platforms. The official web-site of the app is And the documentation section is And, of course, the GitHub is at ""
